Focus

Support enterprise identity in analytics: org-scoped attribution across the joiner-mover-leaver lifecycle.

What to build / complete

- Correct attribution as users move between orgs and roles
- Historical accuracy preserved when org membership changes
- Deletion/deprovisioning respected in analytics and derived data

Execution — work through in order

Phase 3 gives you a goal and a bar, not a recipe. These stages are the discipline; the design decisions are yours to make and defend.

Stage A — Understand & set the bar

1. Re-read the Expected Output and the scoring parameters so you build to the bar, not past it.
2. Confirm every prerequisite and upstream input is actually in your hands, not merely promised.
3. Restate, in one sentence, what 'good' means here: History stays true even as people change jobs, and a deprovisioned user's data leaves the analytics layer too.

Stage B — Build: Correct attribution as users move between orgs and roles

1. Define the metric, its source & the decision

Define precisely what “Correct attribution as users move between orgs and roles” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage C — Build: Historical accuracy preserved when org membership changes

1. Define the metric, its source & the decision

Define precisely what “Historical accuracy preserved when org membership changes” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage D — Build: Deletion/deprovisioning respected in analytics and derived data

1. Define the metric, its source & the decision

Define precisely what “Deletion/deprovisioning respected in analytics and derived data” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage E — Integrate, verify & make demoable

1. Wire your work into the end-to-end flow and run the whole journey once, start to finish.
2. Move a user between orgs and show past activity attributed correctly to the org at that time.
3. Break it on purpose: force the failure path and confirm it degrades the way you designed.
4. Prepare a live demo on real data. Not slides, not screenshots, not 'it works on my machine'.

Done when (demoable by end of task)

- “Correct attribution as users move between orgs and roles” is complete, real, and demoable end-to-end.
- “Historical accuracy preserved when org membership changes” is complete, real, and demoable end-to-end.
- “Deletion/deprovisioning respected in analytics and derived data” is complete, real, and demoable end-to-end.
- Good looks like: History stays true even as people change jobs, and a deprovisioned user's data leaves the analytics layer too.

Worry if any of these are true

- Org changes rewriting history.
- Deleted users persisting in the warehouse.
- Calling an experiment early because it looked good on day two.

Hand-off

- Attribution rules to Backend. Make sure the next person can pick it up without you.
